Sequence 1, Application US/09970516
Fatent No. 6610534
GENERAL INFORMATION:
TATLE OF INVENTION: Induction of blood vessel formation through administration of TITLE OF INVENTION: Dolynucleotides encoding sphingosine kinases
FILE REPRESENCE: 4.31617
CURRENT APPLICATION NUMBER: US/09/970,516
CURRENT APPLICATION NUMBER: US/09/970,516
CURRENT FILING DATE: 2001-10-04
NUMBER OF SEQ ID NOS: 6
SSOFTWARE: Patentin version 3.1
LENGTH: 1155

Patent No. 6747137

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICANS:
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: SO DIAGNOSTICS AND THERAPEUTICS
TITLE REPERENCE: 107196.132
CURRENT APPLICATION NUMBER: US 60/074,725
PRIOR APPLICATION NUMBER: US 60/074,725
PRIOR APPLICATION NUMBER: US 60/096,409
PRIOR FILING DATE: 1998-08-13
NUMBER OF SEQ ID NOS: 28208
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -----TGCACCCCAAACTACCTTTGGATGGTCTGTGGCAGCAGAGATGCCCCAT----CG 1108

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

## Claim 20; Page 134; 586pp; English.

The present line present line present line present line present line present line present line present line present line present line present line present line present line present line present line present line and a carrier; (2) a kit comprising in one or more described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for sereening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or predisposition to a pathology associated with the polypeptide; (12) method for modulating or predisposition. The activity of the polypeptide described above; (13) method for modulating or predisposition, with the above polypeptide; NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, The present invention describes NOVX proteins, where X can be 1 to 55

```
New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynucleotide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous system disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently call proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. parkinson's disease). The present sequence represents the human sphingosine kinase-like protein
                                                                        Human sphingosine kinase-like protein; intracellular signalling; gene; cell proliferation; apoptosis; cancer; allergy; cytostatic; asthma; autoimmune disease; rheumatoid arthritis; Parkinson's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HisGluAlaAlaAsnGlyProAlaProLeuGlyValArgAlaProProAlaTrpArgThr

                                                                                                                                                                                                                                                                                                                               This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to buman tyrosine and serine/threonine protein kinases (FTK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polynucleotide sequence is a human kinase DNA sequence
                                                                                                                                                                                                                                     New nucleic acid molecule encoding a kinase polypeptide, useful for preparing a composition for treating diseases or disorders, e.g., cancer, or neurological, immunological or inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 4429 BP; 1020 A; 1115 C; 1213 G; 1081 T; 0 U; 0 Other;

The present invention describes an isolated PRO nucleic acid (I). Also described: (1) a vector comprising (I); (2) a host cell comprising the vector of (I); (3) a process for producing a PRO polypeptide; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide; (5) a chimeric molecule comprising the polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); an agonist or antagonist of the polypeptide or an antibody that binds to the polypeptide or an antibody that binds to the matter of (7); (9) a method of treating an immune related disease in a matter of (7); (9) a method of treating an immune related disease in a matter of (7); (9) a method of treating an immune related disease in a diagnosing an immune related disease or an inflammatory immune response in a mammal; (10) a method of identifying a compound that inhibits or in mammal; (12) a method of identifying a compound that inhibits or in minics the activity of or expression of a gene encoding a PRO polypeptide; and (13) a method of stimulating the immune response in a mammal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  82
PRO sequences have antiallergic, antianaemic, antiarthritic, antidabetic, antiinflammatory, antipsoriatic, antitisproid, CNS, dermatological, gastrointestinal, haemostatic, hepatotropic, immunostimulant, immunosuppressive, muscular, nephrotropic, neuroprotective, osteopathic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (I) and the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune related disease and in stimulating an immune response. The present sequence represents a human PRO nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TTCACCTTAGCCTCCATCACCACCACCACATCGTTACTGAACATGCTAATCAGGCCAAG

sequence represents cDNA encoding a human ceramide kinase designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                               hCERKI. The invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCRRI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy. hCERKI mediates the ATP-dependent 1-phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders
 neurological disease; inflammation; human immunodeficiency virus;
HIV infection; type 2 diabetee; obseity; sepäis, arteriosclescosis;
cancer; neuroprotective; antiinflammatory; anti-HIV; antidiabetic;
anorectic; antibacterial; antiseptic; antiarteriosclerotic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infection, type 2 diabetes, obesity, sepsis, arteriosclerosis and
                                                                                                                                                                                                                                                                                                                                                                                   Human ceramide kinase gene and the enzyme encoded by it for screening substances as drugs for neurological, inflammatory and other disorders.

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides and cativity of NOVX bolypeptides and polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymeleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators.

C deponists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide expression and activity of NOVX anti-NOVX polypeptide expression and activity of NOVX belypeptides. diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymuclectides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, themaeutopoietic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence
